SINAPSE CRM

Sinapse CRM User Manual

Version of 7 November 2026 · Namibian Ports Authority · Port of Walvis Bay and Port of Lüderitz

Sinapse CRM is the Namibian Ports Authority's system for handling customer queries at Walvis Bay and Lüderitz: every email, portal request, phone call and Sinapse Assist conversation becomes one case with a reference, an owner and a response deadline. This manual is organised by role; read Getting started, then the section for your role.

Getting started

Staff sign in at **/login** on the Sinapse CRM address; customers use **/portal**; the public Ask-us widget is at **/widget**. When Microsoft sign-in is switched on, staff click *Sign in with your Namport Microsoft account* instead of typing a password.

Who sees what

What you see depends on your role. Your first screen after signing in is set by the role.

Role	Lands on	Can do	Sees
Agent	My queue	Work assigned cases, log queries, update customers, draft knowledge	Own port, all departments; SAP number and service agreement hidden
Supervisor	Team queue	Everything an agent can, plus reassign, merge, review filtered mail, approve registrations, publish knowledge, send notices, manage availability	Own port, all departments
Department head	Reports	Dashboards, reassign, findings, publish knowledge	Both ports, own department
Executive	Reports	Dashboards, report builder, read cases and findings	Both ports, all departments; contact phone and email hidden
ICT administrator	Administration	Configuration, users, security, integrations, audit log	Everything needed to run the system
Internal auditor	Findings	Record and track audit findings, read the audit log	Both ports, all departments
System administrator	Reports	Everything	Everything

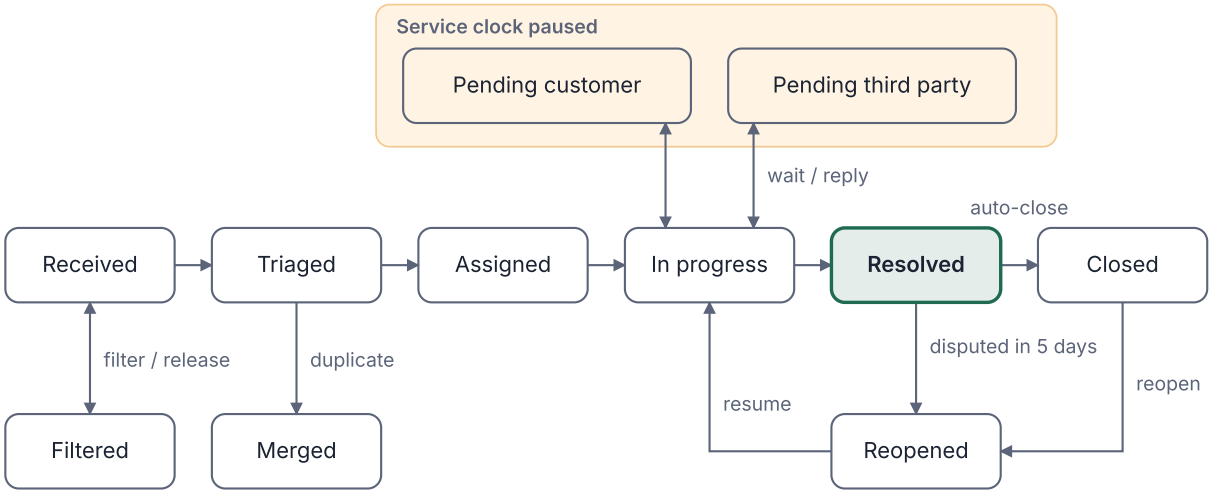

A Walvis Bay supervisor does not see Lüderitz cases, and the reverse. This is enforced inside the database, so exports and reports follow the same rule as the screens.

The screen

- **Top bar** — menu (My queue, Team queue, Log query, Customers, Knowledge, Reports, Port, Findings, Admin; you only see the items your role allows), your port and department, your presence, Notifications, and your initials (click to sign out).
- **Presence** — set *Available*, *Busy*, *Away* or *Offline*. Only Available and Busy agents receive new cases. Out-of-office and leave in your Outlook calendar are read automatically when the Microsoft connection is set up.
- **Notifications** — new assignments, @mentions, customer replies, deadline warnings and escalations. Click one to open its case.
- **On a phone** — the same address works on a phone or tablet; add it to your home screen to install it as an app. Your assigned cases stay readable without signal.

How a case moves

Only waiting on the customer or a third party pauses the clock

Case lifecycle · 11 states

Every query becomes a case that walks the same path: **Received → Triaged → Assigned → In progress → Resolved → Closed**. Triage and assignment happen automatically; agents move the case from Assigned onwards. What the customer sees in the portal is a plainer label for each state (for example *In queue*, *Waiting for your reply*).

- **Filtered** — the intake filter judged the message irrelevant (job applications, spam). Supervisors review filtered items and can release one back to Received.
- **Merged** — the case repeats an existing one. It is closed into the original, the message is kept, and the customer is told which reference to follow. A merge can be done from Received, Triaged, Assigned or In progress.
- **Pending customer / Pending third party** — the agent is waiting on someone outside Namport. The service clock pauses and resumes when the reply arrives. Pending third party needs a reason.
- **Resolved** — needs a resolution note. The customer is asked to rate the service.
- **Reopened** — the customer disputed the outcome within 5 days of resolution, or a staff member reopened a closed case with a reason. It returns to the agent and the reopen count goes up.
- **Closed** — Resolved cases close automatically once the 5-day review window passes.

The service clock

Targets are measured in **business hours**: Monday to Thursday 07:30–16:30, Friday 07:30–13:00, excluding Namibian public holidays. The clock runs in Received, Triaged, Assigned, In progress and Reopened, pauses in the two Pending states, and stops at Resolved.

Service level	First response	Resolution
Standard	4 business hours	24 business hours
Priority	2 business hours	16 business hours

Service level	First response	Resolution
Top 10 customers	1 hour	8 hours
Marine operations (24/7)	1 hour	8 hours

Urgency shortens the target further. At **80 %** of the time used, the assigned agent gets a pre-breach warning; at breach, the case escalates up the escalation matrix (supervisor, then department head). The badge on each case shows the time left, turns solid orange in the last hour, and red once breached.

Agents

New cases are assigned to you automatically; your job is to answer them before their deadline, from one screen.

My queue

My queue lists your open cases, most urgent first. Each row shows the reference, subject, customer, query type and a deadline badge:

- **SLA · 2 h 10 min** (pale orange) — time left on the current target; it turns solid orange in the last hour.
- **Breached** (red) — the target was missed; your supervisor has been alerted.
- **Paused** (grey) — waiting on the customer or a third party; the clock is stopped.
- **Top 10** — a Top 10 customer: shorter targets, faster escalation.
- **Possible duplicate** — the system thinks this repeats an open case.

Change urgency directly in the list. Use the search box (it also searches emails and the text inside attached documents), the filters, **Export CSV**, or **Save view** to keep a filter you use often.

The case screen

Click a reference to open the case. Everything is on one screen:

- **Left** — your queue, so you can move to the next case.
- **Centre** — the case: reference, channel, port, department and status; query type, urgency and owner; status buttons; Sinapse Assist's suggested reply; the full conversation; documents; the reply box.
- **Right** — the customer (company, contact, open cases, SLA attainment, satisfaction), **Port context** (vessel, voyage, berth, window, cargo, corridor), the timeline across all channels, and assignment history.

If the query type shows **AI 77%**, the system guessed it. Click **Confirm**, or pick the right type; your correction teaches the system. If no vessel was detected, link one from the Port context panel.

Answering a customer

The reply box has four tabs:

Tab	Use it to	Customer sees it?
Email	Reply to the customer. The reference goes in the subject so their answer comes back to this case.	Yes, by email and in the portal
Internal note	Write to colleagues. Type @firstname.lastname to give someone a task.	Never
Log a call	Record a phone call: direction, minutes, outcome, notes.	Yes, in the portal history
Attach	Upload a file. Tick *Staff only* to keep it internal. Files are virus-scanned.	Unless Staff only

Under Email, choose:

- **Send and resolve** — sends the reply and resolves the case; the reply becomes the outcome the customer sees.
- **Send only** — sends and keeps the case open.
- **Send and pause the clock** — sends a question and stops the deadline until the customer answers. Their reply restarts it automatically.

Sinapse Assist's draft, when shown, is built from approved knowledge and similar resolved cases. Click **Insert draft**, edit it, then send.

Status buttons

The buttons above the case change its status; only the moves allowed from the current status appear.

- **Resolve** asks for a resolution note, shown to the customer.
- **Await third party** asks for a reason and pauses the clock.
- **Merge into original** joins this case to another one by its reference.
- After resolving, **Propose as knowledge** turns your answer into a draft article for approval.

Logging a phone or walk-in query

1. Click **Log query**.
2. Type the caller's name, email or phone and pick them from the list.
3. Type a subject and what they need. The system predicts the type and urgency and warns you if it looks like a duplicate.
4. Change the type, urgency or port if needed, enter the call length, and click **Save and issue reference**. Give the caller the reference (for example NAM-WB-2026-000123).

The case is assigned straight away, possibly to you.

Supervisors

Supervisors keep work moving: watch the team queue, step in where a deadline is at risk, and clear the review queues daily. You can do everything an agent can.

Team queue and reassigning

Team queue shows every open case at your port, most urgent first. Filter by deadline state, type, port, customer tier, *Unassigned* or *Possible duplicates*, then **Save view** and tick it as a shared queue so the team can use it.

To move a case, click **Reassign** on its row (or on the case screen). The dialog shows every agent, their current load against capacity, and why the system would or would not pick them (for example *out of office (Outlook)*, *at capacity*, *missing skill: marine*). Pick an agent, or *Return to the engine* to let the system choose someone else, type a reason, and click **Reassign**. Reasons are reported, so repeated moves show up as a training or set-up issue.

Deadlines and escalation

You are alerted when a case is about to miss its target (at 80% of the time used), when it misses it, and when it escalates. Escalation follows the matrix:

Level	Goes to	Standard customer	Top 10 customer
1	Supervisor	When the target is missed	When the target is missed
2	Department head	4 hours later	1 hour later
3	Executive (and the customer's escalation contact)	24 hours later	4 hours later

The timers halve when the customer is clearly frustrated or the case is critical. Open alerts are under **Reports → Alerts**; click **Acknowledge** once you have acted. A case nobody can take (everyone away or full) also raises an alert during business hours instead of waiting silently.

Review queues (daily)

Open **Customers → Review queues**:

- **Filtered** — emails the system set aside as irrelevant (CVs, job applications, vacancies, donations, apprenticeships and similar). Nothing is deleted. **Release** sends it on as a normal case and acknowledges the customer; **Confirm filter** closes it. Both teach the filter.
- **Near-duplicates** — cases that look like a repeat of an open case from the same customer. Open one and click **Merge into …** to join it to the original (both customers' messages are kept and the second customer is told the original reference), or **Not a duplicate**.

Approving company registrations

Customers register themselves; you only approve. Open **Customers → Registration approvals**. Each request shows the company, the applicant (and whether their email is verified) and any existing profile that looks the same.

- **Approve** — the company becomes active and the applicant is emailed.
- **Attach to …** — the company already exists; the applicant is added to it instead.
- **Reject** — type a reason; it is sent to the applicant.

Requests from people asking to join an existing company appear below; the company's own administrator can also approve those in the portal.

Agent availability

Admin → Availability shows each agent's presence, out-of-office (marked *Outlook* when read from their calendar), leave and current load. You can set or clear out-of-office and change presence. Cases waiting for a free agent are reassigned as soon as someone becomes available.

Telling customers before they ask

When a berth or window changes, open **Port → Vessel call board**, click **Update** to change the berth or window, then **Notify customers**. The notice goes to every customer with cargo or an open case on that vessel, by email and in the portal, and appears on those open cases. Port-wide notices are under **Port → Proactive notices → New notice**.

Approving knowledge

Agents draft articles; a named approver publishes them. In **Knowledge**, open an article in *Review* and click **Approve and publish**. You cannot publish an article you wrote yourself. Once published, Sinapse Assist and the agents' suggested replies can use it straight away. **Knowledge gaps** lists the questions customers asked that Assist could not answer, most-asked first; click **Write article** on one to fill the gap.

Reports and dashboards

All figures are live (the dashboard refreshes every 30 seconds) and limited to what your role may see, so a department head sees their own department without a separate report. Click a bar, a customer or a count to open the cases behind it.

Open **Reports**. Filter by port, department, customer tier and period (7 days to 12 months) at the top.

Tab	What it shows
Dashboard	Queries in the period and the share customers logged themselves; open backlog; overdue now; SLA attainment, average first response and resolution; volume by type, over time and by customer; resolution time by type; backlog by status and age; the overdue list; queries by trade corridor; channels; customer satisfaction
Agents & departments	Per agent: cases handled, resolved, first response, resolution time, SLA %, reopen rate, open now, backlog age, satisfaction; a weekly trend; the same by department; reassignment patterns and reasons
Corridors	Volume, open cases, resolution time and SLA by corridor (Trans-Kalahari, Trans-Cunene, Walvis Bay–Ndola–Lubumbashi and others), the type mix, weekly trend
Assist deflection	Assist conversations, the share answered with no person involved, hand-overs, declines, most-used articles
Adoption	Week by week: portal registrations, share of queries logged by customers, Assist deflection, customers updating their own details
Report builder	Your own reports (below)
Alerts	Open deadline, escalation, unassigned-case, threshold and overdue-task alerts

Building your own report

1. Open **Reports → Report builder**.
2. Tick up to three things to group by: query type, urgency, department, port, channel, status, customer, customer tier, corridor, agent, or day, week or month.
3. Tick the measures: number of queries, open, resolved, average first response (minutes), average resolution (hours), SLA attainment %, breaches, reopen rate %, time paused waiting on others, escalated.
4. Pick the period and port, then click **Run**.
5. Download it as **CSV**, **Excel** or **PDF**.

To keep it, give it a name and click **Save report**. Choose *Daily*, *Weekly* or *Monthly*, a format and email addresses to have it sent automatically, and tick *Share with colleagues* to let others use it. Scheduled emails need the Microsoft mailbox connection (see Troubleshooting).

Management is alerted automatically when the open backlog passes 150 cases or the 7-day breach rate passes 10%; an administrator can change both limits in **Admin → Settings**.

Audit findings

A finding is closed only when every remediation task is done with evidence, and someone other than its owner has verified it. Auditors, supervisors and department heads record findings; everyone can view them.

Recording a finding

1. Open **Findings** and click **Record finding**.
2. Enter the title, description, source (for example *Internal audit Q3*), type, severity, responsible owner and due date. Add a case reference if a customer case triggered it.
3. Click **Record**. If it closely matches a finding closed earlier, it is flagged as a recurrence.

The owner is notified and clicks **Accept ownership** on the finding.

Remediation tasks

On the finding, type a task, choose an owner and due date, and click **Add**. Each task's status is changed in its row: *Open*, *In progress*, *Done* or *Cancelled*.

- To mark a task **Done**, first attach evidence (the file box on its row) or type a completion note when asked.
- When the last task is done, the finding moves to *Pending verification* by itself.
- An overdue task alerts its owner, the finding owner and the supervisors, once.

Closing

A verifier opens the finding and clicks **Verify and close**, or **Return to remediation** if more work is needed. A closed finding can be reopened. Every change is kept in the finding's **History**.

The register can be filtered by state, severity and *Overdue*. Progress shows as tasks done out of total and a percentage.

Administration

Almost everything about how Sinapse CRM behaves is set in **Admin**, takes effect immediately and needs no developer; every change is recorded in the audit log with its before and after values. ICT administrators and system administrators see all tabs; supervisors see Users and Availability.

Tab	What you set there
Workflows	The statuses a case moves through and the buttons between them (see *Changing a workflow*)
SLA & calendar	Response and resolution targets in business minutes, shorter targets for Top 10 and priority customers, urgency multipliers, when the 80% warning fires; business hours; public holidays
Escalation matrix	Escalation levels: who is told (by role), after how long, by which channel; a separate path for Top 10 customers
Queues & assignment	Queues and how each assigns work: round robin, least loaded, or by skill; which roles and skills may take it
Query types	Each type's workflow, queue, workload weight (a damage claim counts 3, a general question 0.5), skill, and example wording that trains the automatic classification
Custom fields	Extra fields on cases, companies or contacts: type, required, options, format rules, default, help text, which roles and query types see it, whether customers see it in the portal
Filter rules	Words that send an email to the review queue instead of the team (seeded with CV, job application, vacancy, donations, apprenticeship)
Templates	Email and notification wording per event; {{reference}}, {{contact.name}} and similar fill in automatically
Roles & masking	Each role's permissions, whether it sees one port or both and one department or all, which fields are hidden from it, and its first screen
Users	Add staff, set role, port, department, skills and workload capacity, set a password, deactivate leavers
Availability	Presence, out-of-office, leave and live workload per agent
Integrations & API	Connection health and logs for Microsoft sign-in, user provisioning, Outlook mailbox and calendars, Teams, SAP and webhooks; revoke a connection; outbound webhooks; API keys; the API reference
Audit log	Every sign-in, change, read of customer records and administrative action; integrity check; export
Settings	Reference format (NAM-{PORT}-{YYYY}-{SEQ:6}), the 5-day window for customers to dispute a resolution, duplicate sensitivity, Assist and classification confidence, the satisfaction score that opens a follow-up (2 or below), management alert limits

Adding staff

In **Admin → Users**, click **Add user**. Enter the email, name, role, port (or both), department, skills (for example *marine, billing*) and capacity (20 suits a full-time agent), and a password if they will not use Microsoft sign-in. To remove access, open the user and untick **Active**; it takes effect on their next click. When Microsoft user provisioning is connected, joiners and leavers are handled automatically and marked *SCIM*.

Changing a workflow

1. In **Admin → Workflows**, select the published version and click **Create draft from this version**.

2. Edit the statuses (what staff and customers see, and whether the deadline clock runs, pauses or stops) and the moves between them (button label, conditions such as *Has resolution note*, automatic actions such as *Notify customer*).
3. Click **Save draft**, then **Preview against history** to see whether recent cases would have been blocked by the change.
4. Click **Publish**. New cases use the new version; cases already open finish on the version they started with.

Public holidays

Deadlines ignore weekends and the holidays in **Admin → SLA & calendar**. Namibian public holidays for 2025–2030 are loaded, including Easter dates and the Sunday-to-Monday rule. Use **Generate Namibian holidays** for a later year, or add a one-off holiday with its date and name.

Audit log

Admin → Audit log lists who did what and when, with before and after values; filter by action, record, person or date. **Verify integrity** checks that no entry has been changed or removed; it should say *Intact*. **Export CSV** or **Export JSONL** to hand the log to Namport's own monitoring.

Integrations and API

The **Integrations & API** tab shows each connection as healthy, degraded, down or unconfigured, with its recent calls and failures; **Log** shows individual messages and **Revoke** stops a connection immediately. Webhooks send case events to other systems; their signing secret, and any new API key, is shown once only, so copy it straight away. **REST API (OpenAPI)** opens the API reference for developers.

Deployment settings

These are set by whoever runs the hosting (in Render, under the service's environment):

Setting	Purpose
DATABASE_URL	The database (Supabase session pooler address)
PUBLIC_URL	The system's web address, used in email links
ADMIN_EMAIL and ADMIN_PASSWORD	Create or recover an administrator; remove the password after signing in
SEED_DEMO and DEMO_PASSWORD	Load the demo client and demo staff once, with your chosen password
ENTRA_TENANT_ID, ENTRA_CLIENT_ID, ENTRA_CLIENT_SECRET, GRAPH_SHARED_MAILBOX	Microsoft sign-in, sending and receiving email, Outlook availability
SCIM_TOKEN	Automatic staff provisioning from Microsoft Entra ID
TEAMS_WEBHOOK_URL	Alerts to a Teams channel
SAP_ODATA_BASE_URL, SAP_USERNAME, SAP_PASSWORD	SAP customer records
ANTHROPIC_API_KEY	Optional: Sinapse Assist rephrases approved answers more naturally

Customer portal guide

This section is written for Namport's customers and can be shared with them. The portal lets your company log queries, follow them to the outcome, and manage who in your company has access, without phoning Namport.

Registering your company

1. Go to **/portal/register**.
2. Enter your company's registration number, registered name, type of business and the port(s) you use.
3. Enter your own name, work email, phone, position and a password of at least 10 characters. You become your company's administrator.
4. Click **Register**, then click the link in the verification email.
5. Namport approves the registration and emails you. You can then sign in at **/portal/login**.

If your company is already registered, you are not added automatically: your company's administrator, or Namport, approves your request to join.

Logging a query

1. Click **Log a query**.
2. Choose what it is about, or *Not sure* to let Namport classify it, and the port.
3. Write a subject and the details. Include vessel, voyage, container, bill of lading or invoice numbers: they are linked to your query automatically.
4. Attach a document if useful, and click **Submit**.

You get a reference straight away (for example NAM-WB-2026-000123) and the time Namport aims to respond by. Please do not also email the same query: email, phone and portal all land in the same record.

Following a query

My queries lists every query from your company, whichever channel it came in on, with its current status. Open one to see:

- the full history: your messages, Namport's replies, calls and status changes;
- **Add a message** and **Attach**, to add information;
- *Waiting for your reply* when Namport needs something from you; your reply restarts the work.

Replying to a Namport email with the reference in the subject adds your reply to the same query.

When a query is resolved, the outcome is shown at the top. If you disagree, click **I disagree with the outcome** within 5 days and say why: the query reopens. Click **Rate how we did** to score it from 1 to 5; a score of 2 or less opens a follow-up so Namport can put it right.

Managing your company (administrators)

Open **My company**:

- **Add colleague** — enter their name, email and role (operations, finance, escalation or primary). They receive an email to set their password.
- Change a colleague's role, make them an administrator, or **Remove** someone who has left; they lose access immediately.
- Approve or decline people asking to join your company.
- The **Document centre** holds your company's documents; **Upload** adds one.
- The **Interaction history** shows every contact between your company and Namport.

Your escalation contact is informed if one of your queries reaches Namport's executive level.

Your account

- **Notices** — operational notices (for example a berth change for a vessel carrying your cargo) and updates on your queries.
- **Account** — update your name, phone and position; choose whether to be notified by email, in the portal, or both.
- **Two-step verification** — under Account, click **Set up two-step verification**, add the key to an authenticator app (Microsoft or Google Authenticator), and enter the 6-digit code. From then on, sign-in asks for a code.
- **Forgot password?** on the sign-in page emails you a reset link.

Sinapse Assist and the website widget

Sinapse Assist is the assistant in the customer portal and on the website. It answers only from articles Namport has approved, shows its source, and passes the conversation to a person when it cannot help.

What Assist does

Ask it to	Example	Needs sign-in?
Answer a question	"How do I apply for a port access permit?"	No
Give the status of a query	"What is the status of NAM-WB-2026-000123?"	Yes; only your company's queries
Find a lost reference	"I lost the reference for our invoice query"	Yes
Log a query	"Please log a query about our truck turned away at the gate"	Yes, or an email address on the website
Add information to a query	"Add to NAM-WB-2026-000123: the driver's permit number is 4471"	Yes
Escalate a query	"Please escalate NAM-WB-2026-000123"	Yes; urgency is raised and a supervisor alerted
Hand you to a person	"I want to speak to a person"	Yes, or an email address on the website

When it hands over, it opens a case with the whole conversation and what it already tried, so the customer does not repeat themselves. It also hands over by itself when the customer is clearly frustrated, or after it has failed to answer more than once.

What Assist will not do

- **Quote tariffs or prices, promise dates, or interpret contracts.** It says so and offers to open a case for the right team; the customer replies "yes".
- **Guess.** If no approved article answers the question, it says so, offers a case, and records the question in **Knowledge → Knowledge gaps** for staff.
- **Show another company's information**, even when given a reference.
- **Learn by itself.** Only a published article changes what it says.

The website widget

The widget puts an **Ask Namport** button on namport.com.na. It opens Sinapse Assist and a **Send a query** form (name, email, subject, message); a visitor who sends the form gets a reference by email. Visitors who want Assist to reply by email can add their name and email under the chat.

To add it to the website, the web team pastes this line into the site's pages, with the Sinapse CRM address and the port (WB or LZ):

```
<script src="https://YOUR-SINAPSE-ADDRESS/embed.js" data-port="WB" defer></script>
```

The same page can be opened directly at **/widget**.

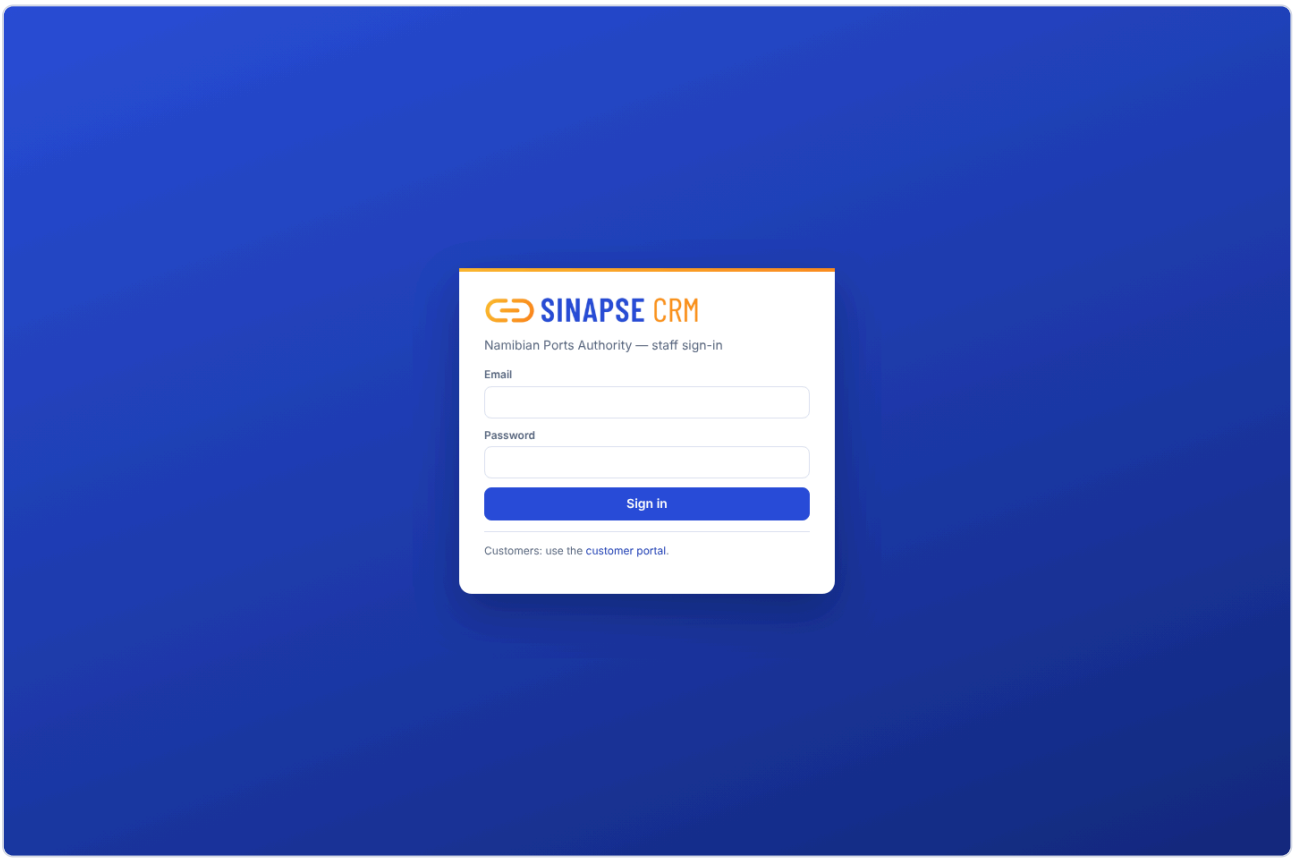

Troubleshooting

Problem	Likely cause	What to do
Emails are not reaching customers (verification links, acknowledgements, replies, scheduled reports)	The Microsoft mailbox connection is not set up yet. Until it is, emails are recorded in the system but not sent.	ICT sets the Entra and mailbox settings (see *Deployment settings*). Until then, self-registered customers cannot verify their email and so cannot sign in; customers can still see replies in the portal.
Staff sign-in says *Email or password is incorrect*	Wrong password, or the account does not exist (demo accounts exist only after the demo is loaded)	An administrator resets the password in **Admin → Users**. If no administrator can sign in, set ADMIN_EMAIL and ADMIN_PASSWORD on the server and redeploy.
Too many attempts	Five wrong passwords in a row	Wait 10 minutes and try again.
Your session has expired	Staff sessions last 10 hours, customer sessions 12	Sign in again.
Customer sees *Please verify your email address first*	The verification link was not clicked	Click the link in the email, or use **Forgot password?**, which sends a new link and activates the account when the new password is set.
A case stays *Unassigned*	Nobody eligible is free: away, offline, out of office, on leave, outside their working hours or at capacity	Set someone's presence to Available, or **Reassign** the case by hand. A supervisor alert is raised during business hours.
A deadline looks wrong	Deadlines count business hours only: Monday–Thursday 07:30–16:30 and Friday 07:30–13:00 Namibian time, excluding public holidays. Berthing and vessel-operations cases run 24/7. Time spent waiting on the customer or a third party is added back.	Check the case's status and the holidays in **Admin → SLA & calendar**.
Assist says it does not have an approved answer	No published article covers the question	Write and publish one; see **Knowledge → Knowledge gaps** for what customers ask most.
A menu item or Admin tab is missing	Your role does not include it	Ask an administrator to change your role in **Admin → Users**.
A customer cannot see a query	It belongs to a company they are not linked to, or it is a staff-only note	Link the person to the company (**Customers** → the company → **Link contact**), or have their company administrator add them.
An upload is refused	Over 25 MB, a program file (.exe, .bat, .js and similar), or it failed the virus scan	Send a smaller file or a document format.
Teams alerts do not appear	TEAMS_WEBHOOK_URL is not set	ICT adds a Teams channel webhook address.

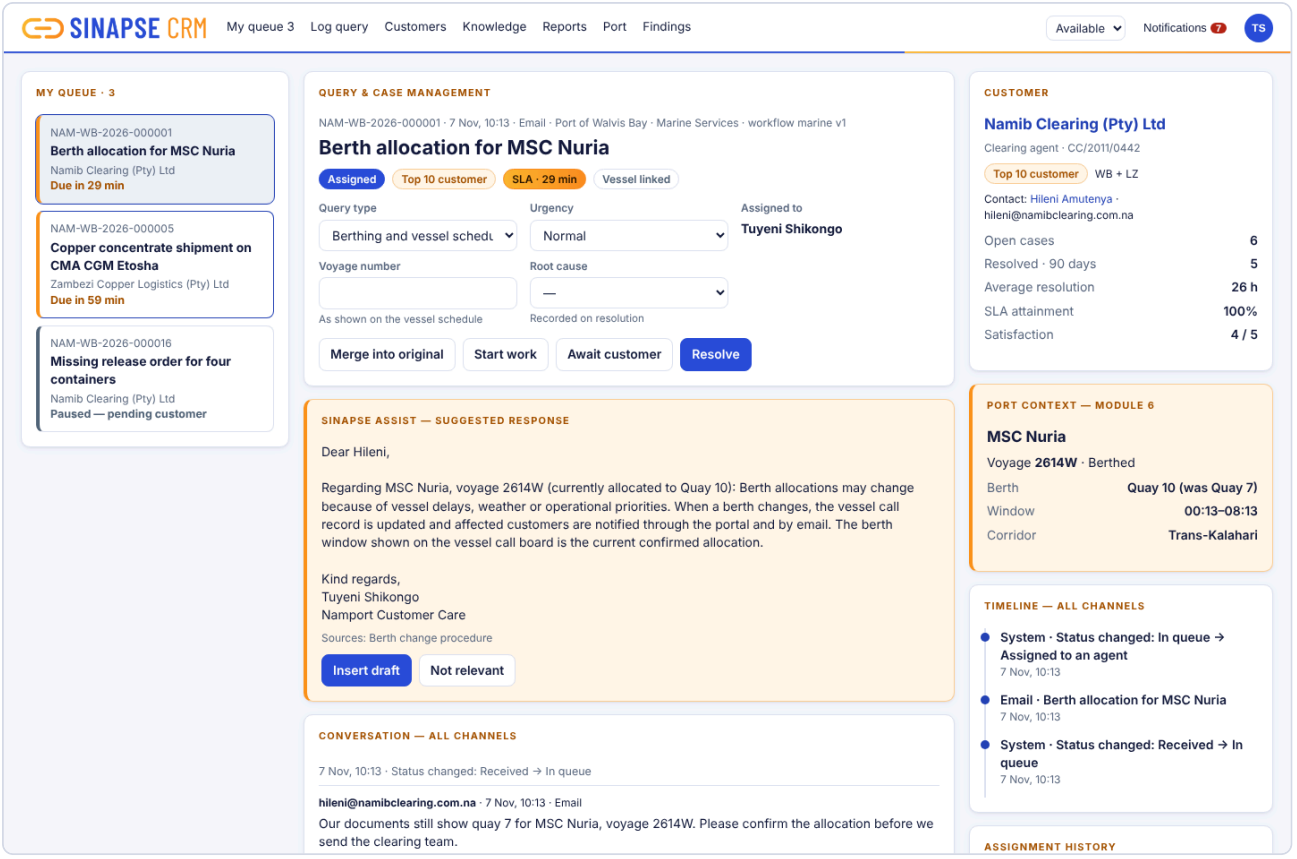

Screenshots

The screens below come from the demo data (Namib Clearing and the demo staff accounts).

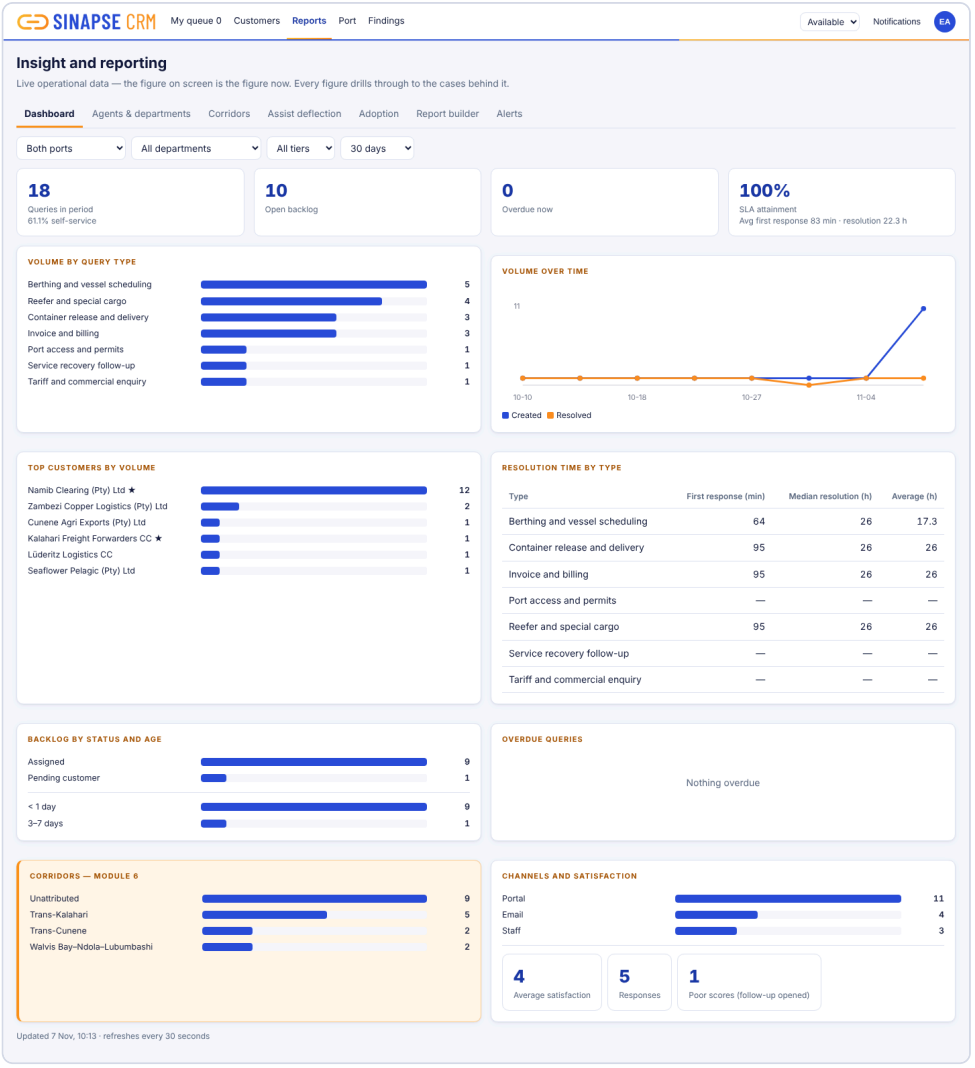

Sign-in page. Staff and customers sign in here; Microsoft sign-in appears once Entra ID is connected.

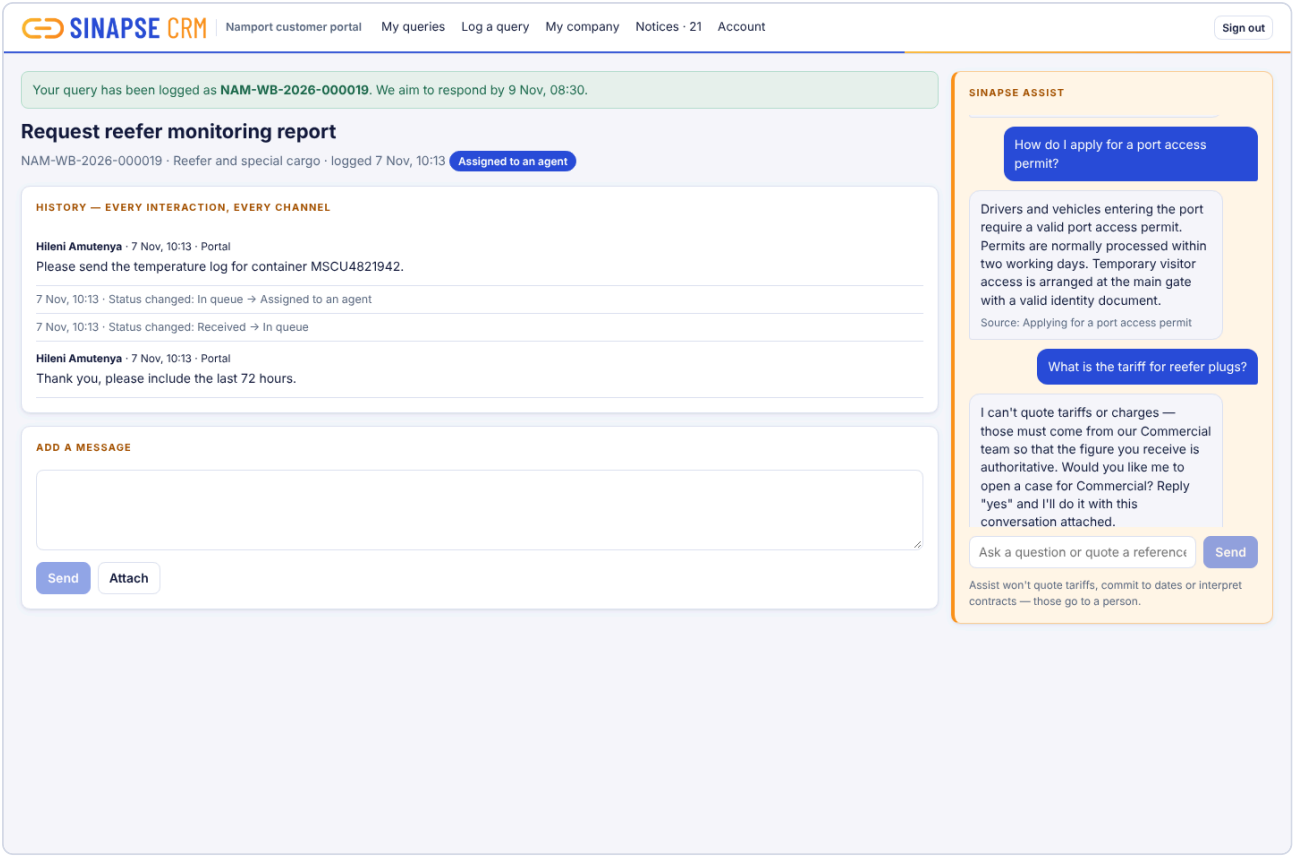

Case view (agent). The case header shows state, service clock and priority; the timeline holds every message, note and change; replies and state changes are made from the panel on the right.

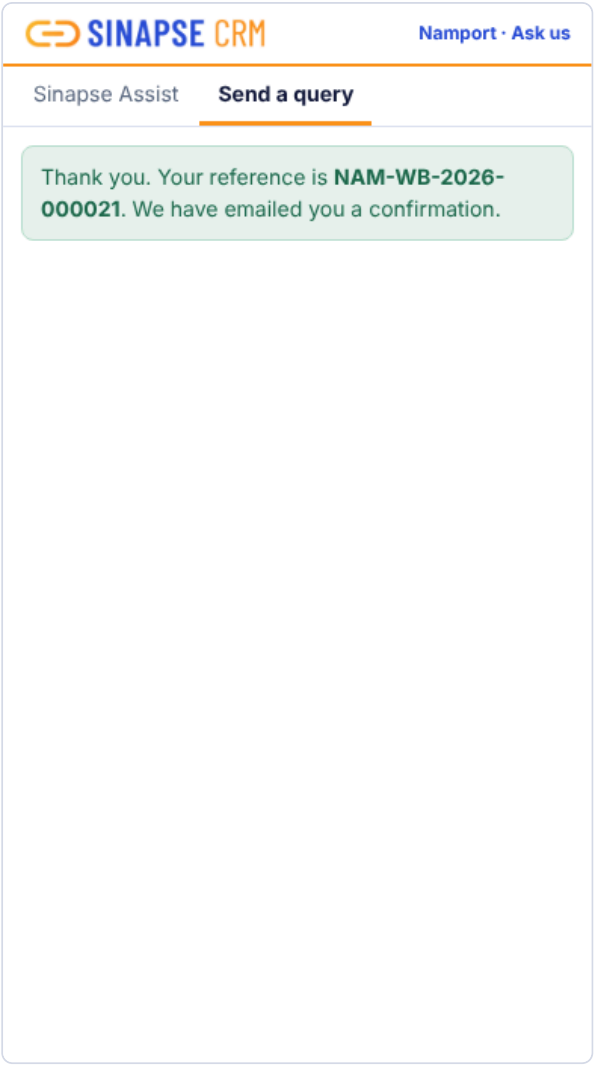

Dashboard (supervisor / executive). Volumes, service-level performance, satisfaction and trends; click a bar to see the cases behind it.

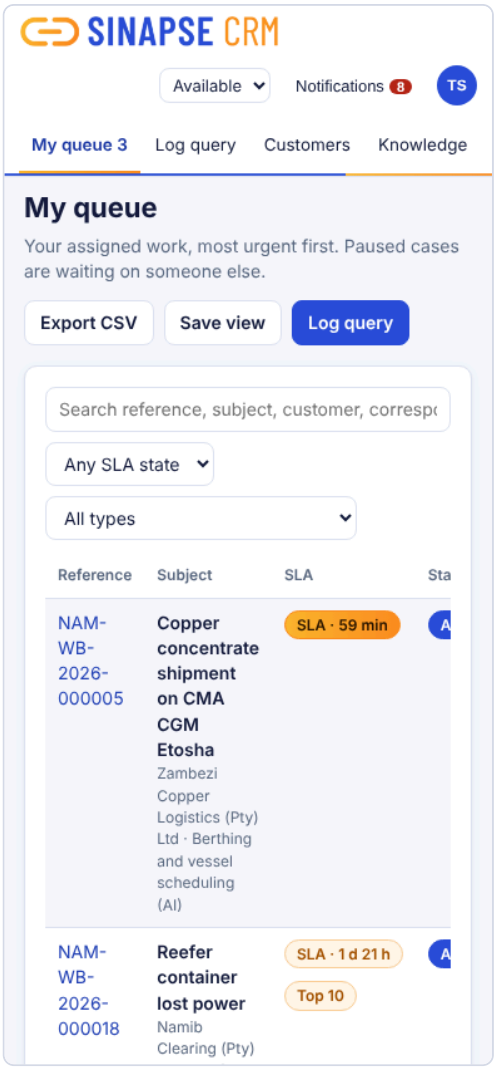

Customer portal. A company's open and past queries with their customer-facing status, plus Sinapse Assist, documents and company users.

Website widget. Sinapse Assist embedded on the Namport website; it answers from published articles or hands over to a person.

Phone view. The app works on a phone and can be installed; assigned work stays readable offline.
